

PRESS RELEASE

ARMONY AI BY OOTARY

Armony AI: oOTARY brings AI to the core of Armony Solution to accelerate creation, migration and automation

Vibe coding, faster Crystal Reports migration and natural-language interaction: with Armony AI, Armony Studio and Armony Hub, oOTARY helps companies shorten the journey from idea to operational solution while keeping costs under control.

*Legacy reports, hard-to-maintain applications and migrations postponed year after year: companies accumulate technical debt that costs them time and money. oOTARY, the software company behind Armony Solution, addresses these challenges with **Armony AI**. Armony Solution is an all-in-one platform that complements ERP systems and brings together three modules (Reports, Data and Apps) to create reports, integrate and synchronize data, and build business applications. Armony AI is natively integrated into these tools with one clear objective: **dramatically shorten time-to-value** for reporting, document and business application projects, regardless of the company's ERP or technology environment.*

*This announcement also includes the upcoming launch of **Armony Studio**, the new unified creation environment, and **Armony Hub**, the new portal for accessing business applications and processes.*

Three tangible benefits

Save time: move from requirement to result in hours rather than weeks. Armony AI handles technical and repetitive tasks, such as analyzing existing assets, rebuilding layouts and generating application elements. Teams deliver faster and focus on what matters most: the business need.

Reduce costs: less manual development and less maintenance. Every report automatically converted and every AI-generated application element saves valuable development time. Migration projects that were often postponed due to budget constraints become financially viable.

Make creation more accessible: **vibe coding for business users.** Describe the application or application elements you need in natural language, and Armony AI designs it. You no longer need to be a developer to turn an idea into a working solution: business and IT teams co-create, faster.

Beyond vibe coding: low-code, freedom of choice and data sovereignty

Vibe coding is appealing because of its speed, but it also has limitations: code can be difficult to review and maintain, security vulnerabilities may arise, and results can remain at the prototype stage. For business applications that handle sensitive data, these risks are not acceptable.

Armony AI goes further. Instead of producing raw code, AI generates structured low-code components in real time, directly visible and editable in Armony Studio. Every component can be reviewed and adjusted instantly. The application is no longer 'almost right': it meets 100% of the customer's requirements while remaining readable, maintainable and scalable.

Open by design. Armony AI is built on the **Model Context Protocol (MCP)**. The result: **no dependency on a single AI provider**. Each company can choose the large language model (LLM) that best fits its needs and balance performance with confidentiality for each use case.

Data sovereignty on your terms. Armony AI also runs on AI servers hosted on premises. This allows companies to keep their data on site, add an extra layer of security and avoid cloud providers' per-token pricing, helping keep costs controlled and predictable.

Crystal Reports: accelerate and simplify report migration

Thousands of reports built with **Crystal Reports** are still at the heart of business operations. Migrating them manually means analyzing each report, rebuilding its layout, recreating its business rules and reconnecting it to the information system—a process that is often lengthy and complex.

With Armony AI integrated into Armony Reports and Armony Studio, **an existing report is analyzed and automatically rebuilt within the Armony environment**. It then only needs to be reviewed, adjusted and connected to the relevant data. PDF documents can also be used as a starting point.

The result: faster conversion of existing reports, a reporting estate that is preserved and enhanced, and a modern, scalable solution built for the future. Technology-agnostic, **Armony AI works across environments**: whatever the company's ERP or information system, converted reports can be easily reconnected to existing data and applications.

Armony Studio: design and code, finally in sync

Armony Studio brings visual design (layouts, application elements and reports) and development (code, components and business rules) together in a single workspace. Users can switch between them instantly, with no loading time. Any layout change is reflected in the code in real time, and vice versa.

Editable tables, complete reports created directly in the layout interface, and existing reports imported with their original structure: Armony Studio is designed to **accelerate every stage, from design to production.**

Armony Hub: talk to your tools and get answers

Armony Hub is the single point of access for users, bringing business applications, information and processes together in one place. With Armony AI integrated, users can make requests in natural language to ask questions, find information or receive guidance. In the future, they will also be able to create tasks, launch actions or trigger processes without navigating through multiple application elements.

AI accelerates, people decide

oOTARY has made a clear choice: AI integrated into real-world use cases, designed to support teams rather than replace them. Validation, customization and expertise remain in human hands.

"Our customers tell us they can no longer wait months to modernize their tools. With Armony AI, work that once took weeks can now be completed in hours. Customers save time, reduce costs and retain full control over the result. That is what useful AI means to us."

Ludovic CORBELET, Sales Director, oOTARY

Armony Studio, Armony Hub and the first Armony AI use cases will be introduced progressively over the coming weeks.

About oOTARY

Founded in 2017 and headquartered in France, oOTARY is a software company specializing in the digitalization of business processes. Its all-in-one Armony Solution platform complements ERP systems and brings together three modules: Reports for simple and complex document and report generation, Data for interfaces and data synchronization (ETL), and Apps for building modern business applications. With Armony AI, oOTARY accelerates the creation, transformation and migration of business tools for customers in France and internationally, with one clear promise: fast, measurable return on investment.
